(a) the floor grows as $c_0 + c_1\bar{n}$
CX gate part, idle-referenced
constant floor (anchored at $\bar{n} = 3$–4)
CX gate part, $\lambda = 3$
bit flips per cycle, cat S3
$\bar{n} = |\alpha|^2$
(b) gate part plus data-derived idle part
S1
S2
S3
S4
S5
idle-referenced
$\lambda = 3$
$\frac{1}{2}e^{-2\bar{n}}$
beyond the data
bit flips per cat and cycle
$\bar{n} = |\alpha|^2$
(c) the bias approaches $\kappa_1 T_c/c_1$ (dotted)
bias Γ_Z/Γ_X (idle-referenced)
S1
S2
S3
S4
S5
$\bar{n} = |\alpha|^2$
(d) logical error: a minimum, not a plateau
$d = 3$
$d = 9$
$d = 15$
ours ($\lambda = 3$)
constant floor
$T_1 = 1$ ms, cycle 1 μs
$\varepsilon_L / \min_{\bar{n}} \varepsilon_L$
$\bar{n}$
