(a) A: charge-coupled defect
data (A4–S4)
defect + smooth channel, $s = 5$
smooth channel alone
smooth channel, $s = 1$
ΔP_g after 800 ns
$|\alpha|^2$
(b) B: critical-current defect
data (A4–S4)
defect + smooth channel, $s = 9$
smooth channel alone
smooth channel, $s = 1$
ΔP_g after 800 ns
$|\alpha|^2$
(c)
reference
binomial weights
$|\alpha|^2 \geq 2$ only
hypothesis A
hypothesis B
idle-referenced
posterior density
strength s of the smooth $f \to g$ channel
